the ambulance reached the hospital at 2:43 p.m., and smith was pronounced dead shortly thereafter.

BASF, the company that developed the newly approved potato amflora, has announced the company's intention to seek approval of other genetically modified (GM) potato varieties in the pipeline.

The patient was also prescribed keflex, an antibiotic. Keflex is often used to treat infections caused by bacteria, such as ear infections, skin infections, and urinary tract infections. It works by stopping the growth of bacteria that cause these infections.

Keflex, which is also known as cephalaxin, is an oral antibiotic that comes in the form of capsules or suspension. It is usually prescribed for a short period of time to treat infections, and it is important to follow the prescribed dosage instructions to ensure the infection is properly treated.

Keflex may be used to treat a variety of infections, including infections of the skin, mouth, throat, ears, and upper respiratory tract. It may also be used to treat infections that occur in the urinary tract, such as bacterial vaginosis.

Keflex works by inhibiting the synthesis of bacterial cell walls, which prevents bacteria from reproducing and spreading. It is effective against a wide range of bacteria, including those that are resistant to other antibiotics.

Keflex is generally well tolerated, but it may cause side effects such as nausea, diarrhea, and vomiting. It is important to follow the prescribed dosage instructions and to report any side effects to a healthcare professional.
